

Criteria for Formulary Consideration of Ceftolozane/tazobactam**Efficacy**

Ceftolozane/tazobactam was approved by the Food and Drug Administration (FDA) on December 19, 2014 for the treatment of complicated intra-abdominal infection (cIAI), in combination with metronidazole, and for the treatment of complicated urinary tract infections (cUTI), including pyelonephritis. Two randomized, phase III trials provide support for these indications. A study for the treatment of nosocomial pneumonia is underway with expected completion in 2018.

Ceftolozane/tazobactam plus metronidazole was noninferior to meropenem for the treatment of cIAI for the primary endpoint of clinical cure rate at the test-of-cure visit (TOC) in the microbiological intent-to-treat (MITT) population. Eradication of *Escherichia coli*, *Klebsiella pneumoniae*, and *Pseudomonas aeruginosa* were comparable to meropenem. In the phase III trial comparing ceftolozane/tazobactam with levofloxacin for the treatment of cUTI, ceftolozane/tazobactam demonstrated statistical superiority. The primary endpoint in this study was noninferiority for composite cure which includes both microbiological eradication and clinical cure rate at the TOC visit.

Ceftolozane/tazobactam's spectrum of activity includes gram-negative bacteria such as *E. coli* and *K. pneumoniae*, including extended-spectrum beta-lactamase (ESBL)-producing strains. This novel cephalosporin also demonstrates potent activity against *P. aeruginosa*, including multidrug-resistant strains. Spectrum gaps do include *Klebsiella pneumoniae* carbapenemase (KPC) and metallo-beta-lactamase producing bacteria. In addition, ceftolozane/tazobactam does not provide activity against gram-positive bacteria such as *Staphylococcus aureus* and *Enterococcus* spp.

Safety

Clinical trials demonstrated that ceftolozane/tazobactam is well-tolerated with most adverse events (>90%) classified as mild in severity. Adverse events were not dose related, and no dose-limiting toxicities were identified. Adverse event rates in phase III clinical trials were not notably different than the comparator agents, meropenem and levofloxacin. The most common adverse events in phase III trials included nausea, diarrhea, headache, fever, insomnia, vomiting, and hypokalemia. Serious adverse events observed in clinical trials included *Clostridium difficile* infection. No deaths occurring during these trials were considered to be related to treatment with ceftolozane/tazobactam. The approved labeling contains warnings and precautions for decreased efficacy in patients with baseline creatinine clearance (CrCl) of 30 to ≤50 mL/min, hypersensitivity reactions, *Clostridium difficile*-associated diarrhea (CDAD), and the development of drug-resistant bacteria.

Uniqueness

Increasing morbidity and mortality associated with antimicrobial-resistant gram-negative bacteria calls for the development of unique antimicrobials that are effective against resistant pathogens. Ceftolozane is a novel cephalosporin with antipseudomonal activity. It has been combined with a familiar beta-lactamase inhibitor for extended spectrum coverage of drug-resistant bacteria. Ceftolozane/tazobactam offers broad spectrum of activity against difficult-to-treat gram-negative bacteria such as ESBL-producing *Enterobacteriaceae* and drug-resistant *P. aeruginosa*. In addition, high levels of AmpC expression do not significantly affect ceftolozane activity as compared to agents like cefepime or piperacillin/tazobactam. Ceftolozane/tazobactam is well-tolerated and requires minimal monitoring.

Cost

Product	Cost per Vial	Dosage	Cost per Day
Zerbaxa™ 1.5 g single-dose vial NDC 67919-030-01	\$83	1.5 g IV every 8 hours	\$249

Recommendation

Introduction¹⁻⁵

There are limited treatment options for infections due to multidrug-resistant gram-negative pathogens such as ESBL-producing *Enterobacteriaceae* and *P. aeruginosa*, including cUTIs and cIAls.

Appropriate management of cIAls involves source control by way of operative or percutaneous interventions. Antibiotic treatment mainly consists of carbapenems, piperacillin/tazobactam, third or fourth generation cephalosporins plus metronidazole, or aminoglycosides. Patients who receive inadequate empiric antibiotic treatment are at a higher risk of treatment failure, sepsis, increased costs, and death. Inappropriate antibiotic treatment is becoming a pressing issue with increasingly more drug-resistant isolates.

Complicated urinary-tract infections may affect the lower urinary tract or upper urinary tract (pyelonephritis). Urosepsis is associated with mortality of up to 40% among critically ill patients. Fluoroquinolones are the most commonly used antibiotic for cUTIs. Other agents include cephalosporins, aminoglycosides, and penicillins. Patients with infections caused by resistant organisms are more likely to be treated inappropriately, have longer hospitalizations, and suffer higher costs than patients infected with more susceptible bacteria.

Ceftolozane/tazobactam, a novel cephalosporin in combination with an established beta-lactamase inhibitor, is approved for the treatment of cIAls and cUTIs caused by ESBL-producing *Enterobacteriaceae* species, drug-resistant *P. aeruginosa*, and some *Streptococcus* species. An ongoing study is evaluating the safety and effectiveness of ceftolozane/tazobactam for treatment of nosocomial pneumonia in addition to the above indications.

Pharmacokinetics⁶⁻⁸**Table 1. Pharmacokinetic Properties of Ceftolozane and Tazobactam at Steady State**

	C_{max} (mg/L)	AUC_{0-tau} (mg·h/L)	Protein Binding (%)	V_d (L)	$T_{1/2}$ (h)	CL (L/h)	Excretion (%)
Ceftolozane 1 g q8h	74.4	182	16-21	13.5	3.12	3.41-6.69	Urine, >95%
Tazobactam 500 mg q8h	18	25	30	18.2	1.03		Urine, >80%

C_{max} : maximum observed concentration, AUC_{0-tau} : area under concentration curve over dosing interval, $fAUC_{0-tau}$: free area under concentration curve over dosing interval, V_d : volume of distribution, $T_{1/2}$: elimination half-life, CL: clearance

Pharmacodynamics⁹⁻¹⁴

Like other cephalosporins, time above MIC (T>MIC) for 40-50% of the dosing interval is the pharmacodynamic parameter that best predicts efficacy for ceftolozane and ceftolozane/tazobactam. In murine thigh infection models, ceftolozane/tazobactam has anticipated %fT>MIC of $\geq 37.5\%$ resulting in 1-3 log reductions in bacterial density for non-ESBL-producing organisms with MICs ≤ 16 mg/L. Among ESBL-producing isolates, ceftolozane/tazobactam showed increased efficacy and a significant decrease in bacterial density of 1.2-1.5-log units over 24 hours compared to piperacillin/tazobactam.

In another infection murine thigh model for ceftolozane/tazobactam against Enterobacteriaceae and *P. aeruginosa*, the T>MIC detected was much less compared to that for other cephalosporins. Mean T>MIC for stasis and 1-log kill was 26% and 32% for non-ESBL-producing Enterobacteriaceae, 31% and 35% for ESBL-producing Enterobacteriaceae, and 25% and 32% for *P. aeruginosa*.

Monte Carlo simulations have demonstrated high probability of target attainment using 40-50% T>MIC with current dosing and susceptibility breakpoints. A 1.5 g dose of ceftolozane/tazobactam given every 8 hours achieved 50% T>MIC for an MIC of 8 mg/L in 90% of subjects (Table 2). In Monte Carlo simulations in subjects with varying renal function, a 50% dose reduction was suggested to achieve the desired target attainment of 40% T>MIC (Table 3). In a simulated ventilator-associated pneumonia population, a dose of ceftolozane 2 g/tazobactam 1 g every 8 hours achieved target attainment of 40% T>MIC in plasma and epithelial lining fluid in >90% of simulations for gram-negative pathogens including *P. aeruginosa* (MIC range 0.12 to >32 mg/L), *E. coli* (MIC range ≤ 0.06 to 4 mg/L), and *K. pneumoniae* (MIC range 0.12 to >32 mg/L).

Table 2. Probability of Target For Three Dosing Regimens Using Monte Carlo Simulation

MIC (mg/L)	1500 mg every 8 hours (60 minute infusion)			1500 mg every 8 hours (3 hour infusion)			3000 mg every 8 hours (60 minute infusion)		
	30% T>MIC	40% T>MIC	50% T>MIC	30% T>MIC	40% T>MIC	50% T>MIC	30% T>MIC	40% T>MIC	50% T>MIC
0.5	100	100	100	100	100	100	100	100	100
1	100	100	100	100	100	100	100	100	100
2	100	100	100	100	100	100	100	100	100
4	100	100	99.7	100	100	100	100	100	100
8	100	98.2	89.8	100	100	99.4	100	100	99.4
6	96.1	74.9	44.9	97.9	91	70.3	100	98.8	90.7

Table 3. Probability of Target Attainment Based on Monte Carlo Simulation in Patients with Varying Renal Function

Ceftolozane/tazobactam Dose	MIC (mg/L)	Renal Function	Probability of Target Attainment for 40% T>MIC
1000 mg/500 mg every 8 hours	8	Normal	87.6%
1000 mg/500 mg every 8 hours	8	Mild impairment	100%
500 mg/250 mg every 8 hours	8	Moderate impairment	100%

The PBP profile of ceftolozane has been compared to ceftazidime, a PBP3 inhibitor, and imipenem, a PBP2 inhibitor. Ceftolozane showed greater than 2-fold higher potency for PBPs 1b, 1c, 2, and 3 compared to ceftazidime. Compared to imipenem, it showed higher affinity for PBP1b but lower affinity for PBP1c. Ceftolozane alone has low affinity for PBP4 and demonstrates weak induction of AmpC expression.

Pharmacology and Microbiology²⁻⁵

Ceftolozane is a cephalosporin antibiotic. It has bactericidal action due to inhibition of cell wall biosynthesis and is mediated through binding to penicillin-binding proteins (PBPs). Ceftolozane inhibits PBPs of *P. aeruginosa* (PBP1b, PBP1c, PBP3) and *E. coli* (PBP3). Tazobactam is an irreversible inhibitor of certain penicillinases and cephalosporinases and can bind covalently to some chromosomal and plasmid-mediated beta-lactamases. Tazobactam has little clinically relevant *in vitro* activity against bacteria due to reduced affinity for PBPs. Susceptibility interpretative criteria, *in vitro* activity against specific bacteria, and *in vitro* activity against specific β -lactamases are highlighted in Tables 4-6, respectively.

Table 4. Susceptibility Interpretive Criteria for Ceftolozane/Tazobactam

Pathogen	Minimum Inhibitory Concentration (mg/L)			Disk Diffusion Zone Diameter (mm)		
	S	I	R	S	I	R

FDA Approved Indications^{6,15}

The FDA approved ceftolozane/tazobactam on December 19, 2014 for the treatment of patients 18 years or older with the following infections caused by designated susceptible microorganisms:

- Complicated intra-abdominal infections, in combination with metronidazole, caused by *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Bacteroides fragilis*, *Streptococcus anginosus*, *Streptococcus constellatus*, and *Streptococcus salivarius*.
- Complicated urinary tract infections, including pyelonephritis, caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, and *Pseudomonas aeruginosa*.

In order to reduce the development of drug resistant bacteria and maintain the effectiveness of ceftolozane/tazobactam, it should only be used to treat infections that are proven or strongly suspected to be caused by susceptible bacteria.

Clinical Trials^{16,17}

Drug-related Adverse Events Leading to Discontinuation:

- Ceftolozane/tazobactam + metronidazole: n=3 (0.6%)
- Meropenem + placebo: n=4 (0.8%)

Serious Adverse Events:

- Ceftolozane/tazobactam + metronidazole: n=39 (8.1%)
- Meropenem + placebo: n=36 (7.2%)

Deaths:

- Ceftolozane/tazobactam + metronidazole: n=11 (2.3%)
- Meropenem + placebo: n=8 (1.6%)
- None of the deaths considered to be related to the study treatment

Drug-related Adverse Events Leading to Discontinuation

- Incidence <2% in both treatment groups

Serious Adverse Events

- Ceftolozane/tazobactam: n=15 (2.8%)
- Levofloxacin: n=18 (3.4%)

Death

- Ceftolozane/tazobactam: n=1
- Not considered to be related to the study treatment

Warnings, Precautions, and Adverse Effects^{6,16,17}

<i>Warning/Precaution</i>	<i>Description</i>
Decreased efficacy in patients with baseline CrCl of 30 to ≤50 mL/min	In a subgroup analysis of a phase III cIAI trial, clinical cure rates were lower in patients with baseline CrCl of 30 to ≤50 mL/min compared to those with CrCl > 50 mL/min. This was more marked in the ceftolozane/tazobactam plus metronidazole arm compared to the meropenem arm. A similar trend was also seen in the cUTI trial. Monitor CrCl at least daily in patients with changing renal function and adjust the dosage accordingly.
Hypersensitivity reactions	Serious and occasionally fatal hypersensitivity reactions and anaphylaxis have been reported in patients receiving beta-lactam antibiotics. Inquire about previous hypersensitivity reactions to other cephalosporins, penicillins, or other beta-lactams. Cross-sensitivity has been established.
<i>Clostridium difficile</i> -associated diarrhea (CDAD)	CDAD has been reported for nearly all systemic bacterial agents, including ceftolozane/tazobactam, and may range in severity from mild diarrhea to fatal colitis. CDAD must be considered in all patients who present with diarrhea following antibiotic treatment. If confirmed, discontinue antibacterials not directed against <i>C. difficile</i> , if possible.
Development of drug-resistant bacteria	Prescribing of ceftolozane/tazobactam in the absence of a proven or strongly suspected bacterial infection is unlikely to provide benefit and risks the development of drug-resistant bacteria.
Increased mortality	In phase 2 and 3 cIAI trials, there was an increased mortality associated with patients in the ceftolozane/tazobactam + metronidazole arm (2.5%, 14/564) compared to the meropenem arm (1.5%, 8/536). Causes of death included worsening and/or complications of infection, surgery, and underlying conditions.
Pregnancy category B	No adequate and well-controlled studies in pregnant women.

Thrombocytosis	1.9%	0.4%
Laboratory		
Increased alanine aminotransferase	1.5%	1.7%
Increased aspartate aminotransferase	1%	1.7%

Interactions⁶

Ceftolozane and tazobactam do not inhibit or show potential for induction of the cytochrome P450 enzyme system and there is limited potential for significant drug-drug interactions. Tazobactam is a known substrate for OAT1 and OAT3. Coadministration with probenecid, an OAT1/OAT3 inhibitor, has been shown to prolong the half-life of tazobactam by 71%. Coadministration of ceftolozane/tazobactam with drugs that inhibit OAT1 and/or OAT3 may increase tazobactam plasma concentrations.

Dosage and Administration⁶

Table 10. Recommended Dosage

<i>Indication</i>	<i>Dose^a</i>	<i>Route</i>	<i>Infusion Time</i>	<i>Frequency</i>	<i>Duration</i>
cUTI	1.5 g	Intravenous	1 hour	Every 8 hours	7 days
cIAI ^b	1.5 g	Intravenous	1 hour	Every 8 hours	4-14 days

^aCeftolozane/tazobactam 1.5 g contains ceftolozane 1 g and tazobactam 500 mg

^bUsed in conjunction with metronidazole 500 mg intravenously every 8 hours

Table 11. Dosage Recommendations in Special Populations

<i>Special Population</i>	<i>Recommendation</i>	
Renal impairment	CrCl >50 mL/min	No dosage adjustment necessary
	CrCl 30-50 mL/min	750 mg (500 mg and 250 mg) every 8 hours
	CrCl 15-29 mL/min	375 mg (250 mg and 125 mg) every 8 hours
	CrCl <15 mL/min, not on dialysis	No dosage adjustments provided in the labeling
	End-stage renal disease on hemodialysis	Administer single loading dose of 750 mg (500 mg and 250 mg) followed by a 150 mg (100 and 50 mg) maintenance dose administered every 8 hours. On hemodialysis days, administer the dose at the earliest possible time following completion of dialysis.
Hepatic impairment	No dosage adjustment necessary	
Geriatric patients	Dosage adjustments should be based on renal function	
Pediatric patients	Safety and effectiveness has not been established in patients less than 18 years of age	
Gender	No dosage adjustment is recommended based on gender	
Race	No dose adjustment is recommended based on race	

Monitoring Parameters⁶

Monitor serum creatinine and CrCl at baseline and daily in patients with changing renal function.

How Supplied/Cost/Preparation^{6,11}

Table 12. Product Supply

<i>Product</i>	<i>Cost per Vial</i>	<i>Dosage</i>	<i>Cost per Day</i>
Zerbaxa™ 1.5 g single-dose vial NDC 67919-030-01	\$83	1.5 g IV every 8 hours	\$249

Constitute the vial with 10 mL of sterile water for injection or 0.9% Sodium Chloride for Injection, USP and shake gently to dissolve. The final volume is approximately 11.4 mL. The constituted solution is not for direct injection. To prepare the required dose, withdraw the appropriate volume from the reconstituted vial. Add the withdrawn volume to an infusion bag containing 100 mL of 0.9% Sodium Chloride for Injection, USP or 5% Dextrose Injection, USP. Inspect drug products visually for particulate matter and discoloration prior to use. Ceftolozane/tazobactam infusions range from clear, colorless solutions to solutions that are clear and slightly yellow.

Compatibility of ceftolozane/tazobactam with other drugs has not been established. Ceftolozane/tazobactam should not be mixed with other drugs or physically added to solutions containing other drugs.

Upon constitution with sterile water for injection or 0.9% sodium chloride injection, reconstituted ceftolozane/tazobactam solution may be held for one hour prior to transfer and dilution in a suitable infusion bag. Following dilution of the solution with 0.9% sodium chloride or 5% dextrose, ceftolozane/tazobactam is stable for 24 hours when stored at room temperature or 7 days when stored under refrigeration at 2-8°C (36-46°F).

Non-Formulary Utilization Data¹⁸

A total of 5 patients have received non-formulary ceftolozane/tazobactam for infections due to multidrug resistant pathogens, all with consultation with an infectious diseases service, from January 2015 – September 2015.

Appendix A: Summary of Safety Issues and Implications for Pharmacy Operations

Characteristic	Summary
Drug generic name (brand name)	Ceftolozane/tazobactam (Zerbaxa™)
Drug manufacturer	Merck
Schedule of medication	None
Anticipated use per month, anticipated patient population	<5 patients with infections due to MDR organisms with no other treatment options
Route of administration	Intravenous
Does the product package insert currently have any black box warning?	No
Contraindications or significant warnings against medication use?	Contraindicated in patients with known serious hypersensitivity to ceftolozane/tazobactam, piperacillin/tazobactam, or other members of the beta-lactam class.
Is there a Risk Evaluation and Management Strategy (REMS) program for the medication? If so, where may healthcare providers find these criteria?	No
Does the manufacturer require patients to meet specific criteria for treatment with this medication? If so, where may healthcare providers find these criteria?	No
Does the manufacturer have a restricted or special distribution program? If so, how may healthcare providers contact the program?	No
Is the medication (brand name, generic name, product packaging) similar to any other medications on the Institute for Safe Medication Practices (ISMP) Sound-Alike-Look-Alike (SALA) list? If not, is the medication expected to be added to the list?	No, not expected to be added to the list.
Recommended storage conditions for medication, and how to manage excursions outside these conditions	Store intact vials at 2°C to 8°C (36°F to 46°F); protect from light. Reconstituted solution may be held for 1 hour prior to transfer and dilution in an infusion bag. Diluted solution may be stored for 24 hours at room temperature or for 7 days at 2°C to 8°C (36°F to 46°F); do not freeze
Preparation	Constitute the vial with 10 mL sterile water for injection or NS. Gently shake to dissolve. Final volume is approximately 11.4 mL and contains ceftolozane/tazobactam 1.5g. Withdraw the appropriate volume from the reconstituted vial. Add the withdrawn volume to an infusion bag containing 100 mL of NS or D5W.
Stability	Keep intact vials at 2-8°C (36-46°F); protect from light. Keep diluted solution for 24 hours at room temperature or for 7 days at 2-8°C (36-46°F).
Are Safe Handling precautions required?	No
Does the medication require disposal in a Resource Conservation and Recovery Act (RCRA) black box?	No
Can medication doses be sent to patient care units via pneumatic tube system?	Yes
Is filtration required during preparation or administration of the IV medication?	No
Is the IV medication a vesicant or irritant?	No
Is special monitoring recommended when starting therapy with this medication (eg. Telemetry)?	No
Is there a significant risk of a hypersensitivity risk with this medication?	No
