

Do you or your partner have mild dementia due to Alzheimer's Disease?

We are recruiting for a research study looking at how the social connections between persons with mild dementia and their spouse or romantic partner impact their health and well-being.

What does this research study involve?

- You and your study partner will visit with the study team at the University of Nebraska Medical Center at baseline and again 1 year later.
- You both will complete questionnaires at home about your health, life, and activities.
- You will complete cognitive tests.
- You will have a few short conversations with your partner about topics in your lives.
- You both will also have the option of wearing a watch for 2 weeks to help us understand your daily activities.

What are the potential benefits of participating in the study?

- Eligible participants may receive compensation for study-related time and travel.
- You will have an opportunity to meet with a caregiver expert that can discuss your test results and offer caregiver strategies.

You may be eligible for the research study if:

- You or your partner have mild dementia due to Alzheimer's Disease
- You and your partner live together
- Both of you are able to visit UNMC 2 times at start of study and again one year later

If you want to hear more about the study, please call us at **531-559-2436**
