Are we missing cases of ataxia?

Take 20 minutes to help clarify the best way to examine a patient with ataxia!

You are invited to participate in this study because you are a member of the medical field. We are investigating the most sensitive exam technique to identify ataxia within different levels of training.

The total time for completion of this exercise is about 20 minutes. Participation would require you to watch a series of short video clips online and give your opinion on whether ataxia is present.

Results from this study could change the way we teach ataxia testing, and ultimately could contribute to the earlier identification of ataxia in patients.

Although not required, those who complete the survey will be invited to take it again few weeks after for reliability testing.

Please email us if you are interested in participating, and we will send you the link to the survey. (becky.thompson@unmc.edu).
